## CHAPTER I

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|
| AERO-ENGINE IGNITION . . . . .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 1 |
| <p>The spark discharge—The corona discharge—Effect of air pressure—Electrode temperature—Impulse ratio—Aircraft ignition systems—The oscillation transformer—Transformer theory prior to and succeeding gap rupture—Effects of reclosure of primary circuit during secondary discharge—Basic types of aircraft magnetos—The establishment of primary current—Magnet flux curves—Contact breakers and contact arcing—Screening and altitude performance—Discharge duration and its effects—Coil ignition—The booster coil—Spark plug</p> |   |

## CHAPTER II

|                                                                                                                                                                                                                                                                                   |    |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
| THE DESIGN, CONSTRUCTION, AND TESTING OF IGNITION APPARATUS . . . . .                                                                                                                                                                                                             | 62 |
| <p>The booster coil—Magnet and booster coil primary currents—Coil construction—Distributors—Voltage measurements—Cathode ray oscillograph—Flux measurement—Spark energy measurement—Turns measurement—Self-capacity, its calculation and measurement—Detection of metal loops</p> |    |

## CHAPTER III

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |    |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
| AIRCRAFT GENERATORS AND MOTORS—DIRECT CURRENT . . . . .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 84 |
| <p>Direct current systems—Auxiliary power plants—Direct current generators—Magnetic and electric loading factors—Output coefficients—Voltage fluctuation or ripple—The elimination of ripple—Commutation—Brushes and brush stability—Heating and temperature rise—Influence of fan cooling, slipstream, and forced draught ventilation—Aircraft motors—Output coefficients—Motor characteristics—Reversible running—Short time rating and temperature rise—Insulation resistance of aircraft equipment—Moisture absorption—Insulating materials—Impregnation</p> |    |

## CHAPTER IV

|                                                                                                                                                                                                                                                                                                                                                                                                                                                           |     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| ALTERNATING CURRENT IN AIRCRAFT . . . . .                                                                                                                                                                                                                                                                                                                                                                                                                 | 134 |
| <p>Frequencies employed—High-frequency induction motors—Influence of frequency on motor performance—Aircraft alternators—The inductor, double current generator—Influence of frequency on transformer design—A.C. rectification—Copper-oxide, selenium and valve rectifiers—Voltage ripple—Advantages of three-phase and six-phase circuits—Ripple smoothing—Instrument operation by a.c. currents—The autosyn—Instrument lighting by discharge lamps</p> |     |

## CHAPTER V

|                                                                                                                                      |     |
|--------------------------------------------------------------------------------------------------------------------------------------|-----|
| VOLTAGE REGULATION IN AIRCRAFT . . . . .                                                                                             | 162 |
| <p>The third brush generator—Method of application of armature reaction—Mathematical theory—Derivation of cut-in and peak speeds</p> |     |

## CONTENTS

ix

PAGE

and maximum output—Effect of change of position of third brush—Influence of state of charge of battery—Output variation; shunt field resistance and booster field methods—Automatic output control—The control field generator—Principle of operation—Control, shunt and series field windings—Compounding—Machine characteristics—The vibrating contact regulator—Theory of operation—Influence on generator waveform—The points resistance—Arc and spark discharges—The parallel field resistance—Arc suppression by means of rectifier—Influence of  $R$  and  $R_p$  on generator waveform—The bucking winding—The compensating winding—The current limiter—Influence of regulator temperature on voltage setting—The carbon pile regulator—Contact resistance/pressure characteristics—Resistance/pressure characteristic of carbon pile—Theory of carbon pile regulator—Hysteresis effects—The Newton regulator—Damping—Generator characteristics when controlled by carbon pile regulators—The tapped-resistance regulator—Voltage regulation of alternators—The thyatron regulator—The autoswitch or cut-out

## CHAPTER VI

### RADIO SUPPLY IN AIRCRAFT . . . . . 217

The rotary transformer—General principles of d.c. and a.c. rotary transformers as applied to aircraft—Two, three, and four commutator machines—Permanent magnet and wound field machines—The vibrator converter—Ripple effects in coupled windings

## CHAPTER VII

### RIPPLE-SMOOTHING CIRCUITS AND RIPPLE-VOLTAGE MEASUREMENTS . . . . . 236

Ripple-smoothing circuits—Effect of armature inductance—Iron-cored inductances—Inductance to superposed a.c. currents—Incremental permeability—Influence of frequency—Smoothing circuit and choke design—Ripple-voltage measurement—Typical circuits—Valve voltmeters—Peak-voltage measurement—The slide-back method—Peak ripple measurement with gas discharge triode

## CHAPTER VIII

### PERMANENT MAGNETS AND THEIR APPLICATION IN AIRCRAFT 258

The available magnet materials—The permanent magnet circuit—The determination of magnet dimensions— $BH_{max}$  and its derivation—Magnetic energy—The significance of  $BH_{max}$ —Magnetic leakage—Magnetizing and demagnetizing—Aircraft magneto magnet design—Determination of performance of a given magnet—The rotating magnet—Rotary transformer magnets—Magnet testing and magnetic measurements

## CHAPTER IX

### AIRCRAFT PYROMETRY . . . . . 296

Thermo-electricity—Aircraft thermocouples—Engine temperature measurement—Couples for oil and sparking plug temperature measurement—Homogeneity and heterogeneity of pyrometer materials—Reproducibility of thermocouples—Checking couple materials—Compensating leads—Cold junction temperature—Standard thermocouples—Production testing

## CHAPTER X

## METHODS OF CONNECTION AND DISCONNECTION: SWITCHGEAR 317

Circuit interruption—D.C. circuits—Arc characteristics—Switching of A.C. currents—Contact resistance—Contact materials—Types of aircraft switches—Solenoid switches—Switchboards—Plugs and sockets—Switch testing

## CHAPTER XI

## BATTERIES . . . . . 353

Lead - acid batteries — Active materials — Separators — Electrolyte — Battery containers—Chemical and physical reactions—Charging—Internal resistance—Battery faults—Types of lead-acid batteries in aircraft—The alkaline accumulator—Nickel-iron and nickel-cadmium types—Battery testing

## INDEX . . . . . 379
